## **Description**

**MOD. V1720**  
*8 CHANNEL 12 BIT*  
*250 MS/S DIGITIZER*

CAEN will repair or replace any product within the guarantee period if the Guarantor declares that the product is defective due to workmanship or materials and has not been caused by mishandling, negligence on behalf of the User, accident or any abnormal conditions or operations.

**CAEN declines all responsibility for damages or injuries caused by an improper use of the Modules due to negligence on behalf of the User. It is strongly recommended to read thoroughly the CAEN User's Manual before any kind of operation.**

*CAEN reserves the right to change partially or entirely the contents of this Manual at any time and without giving any notice.*

### **Disposal of the Product**

*The product must never be dumped in the Municipal Waste. Please check your local regulations for disposal of electronics products.*

**MADE IN ITALY :** We stress the fact that all the boards are made in Italy because in this globalized world, where getting the lowest possible price for products sometimes translates into poor pay and working conditions for the people who make them, at least you know that who made your board was reasonably paid and worked in a safe environment. (this obviously applies only to the boards marked "MADE IN ITALY", we can not attest to the manufacturing process of "third party" boards).

[31]	0 = Positive Logic 1 = Negative Logic
[30:11]	<i>reserved</i>
[11:0]	With "Full Suppression based on the amplitude", the 12 LSB represent the value to be compared with each sample of the event; and see if it is over/under threshold (depending on the used logic). With "Zero Length Encoding", the 12 LSB represent the value to be compared with each sample of the event, and see if it is "good" or "skip" type).

With "Zero length encoding" (ZLE) bit [31:16] allows to set/read N <sub>LBK</sub> : the number of data to be stored before the signal crosses the threshold. bit [15:0] allows to set/read N <sub>LFWD</sub> : the number of data to be stored after the signal crosses the threshold)

## 2.5. Channel n Threshold (0x1n80; r/w)

Bit	Function
[11:0]	Threshold Value for Trigger Generation

Each channel can generate a local trigger as the digitised signal exceeds the V<sub>th</sub> threshold, and remains under or over threshold for N<sub>th</sub> [4 samples; 5 samples in Pack2.5 mode] at least; local trigger is delayed of N<sub>th</sub> [4/5 samples] with respect to input signal. This register allows to set V<sub>th</sub> (LSB=input range/12bit).

## 2.6. Channel n Over/Under Threshold (0x1n84; r/w)

Bit	Function
[11:0]	Number of Data under/over Threshold

Local trigger coincidence level must be smaller than the number of channels enabled via bit[7:0] mask.

EXTERNAL TRIGGER ENABLE (bit30) enables the board to sense TRG-IN signals

SW TRIGGER ENABLE (bit 31) enables the board to sense software trigger (see § 2.20).

$N_{post} = \text{PostTriggerValue} * 4 + \text{ConstantLatency}$ ; where:

$N_{post}$  = number of post trigger samples.

PostTriggerValue = Content of this register.

ConstantLatency = constant number of samples added due to the latency associated to the trigger processing logic in the ROC FPGA; this value is constant, but the exact value may change between different firmware revisions.

[3]	0 = Optical Link interrupt disabled 1 = Optical Link interrupt enabled
[2 :0]	Interrupt level (0= interrupt disabled)

Bit [7]: this setting is valid only for interrupts broadcasted on VMEbus; interrupts broadcasted on optical link feature RORA mode only.
